

Requirement Analysis Report

Project Title: E-Commerce Order Management Database System

1. Introduction

This report analyzes the business requirements of an E-Commerce Order Management System. The system is designed to manage customer data, products, orders, payments, shipments, and reviews efficiently.

2. Business Overview

The company operates an online shopping platform where customers can browse products, place orders, and track deliveries. A centralized database is required to ensure data accuracy and smooth operations.

3. Purpose of Core Entities

- Customer: Stores customer details
- Category: Classifies products
- Product: Stores product details
- Supplier: Manages supplier information
- Order: Records customer orders
- Order Details: Stores items in each order
- Payment: Tracks payment details
- Shipment: Manages delivery process
- Review: Stores customer feedback

4. Business Processes

- Customer Registration
- Product Browsing
- Order Placement
- Payment Processing
- Shipment Tracking
- Review Submission

5. Conclusion

This system will improve efficiency, reduce redundancy, and ensure better data management.
